# Borehole Acoustic Wavefield Modeling with a “Cluster-in-a-Box”

**Kristoffer Walker**  
Acoustic Research Petrophysicist

[KristofferWalker@Chevron.com](mailto:KristofferWalker@Chevron.com)  
650-814-4452

9/11/2020

# About the Author

- Kristoffer Walker
  - 2 years, Senior Research Petrophysicist, Chevron
  - 5 years, Acoustic Algorithms and Data Processing Team Lead, Halliburton
  - 10 years, Green Scholar and Research Geophysicist, IGPP, Scripps Institution of Oceanography, Univ. of California, San Diego
  - Masters/PhD, Stanford, 2000/03
  - Interests: Borehole Acoustics, Seismology, DAS, Anisotropy, Rock Physics, Geomechanics, Fishing, Running

# Acknowledgements

- Feature advice and feedback: Alexei Bolshakov
- Modeling code development: Thor Johnsen, Robert Mallan
- Sonic3DGUI app development support: Bin Qiu
- Azure cloud-based support: Bhavani Kambham, Raymond Laganao, Xin Dong, Mason Edwards, Bin Qiu, Tony Sutippantupat, and Stefan Hertel
- MATLAB license support: Keith Droge, Dave Blackman, and Anne Draucker

# Motivation

- How does Chevron “win in any environment” in Borehole Acoustics?
- We need to know if vendor data products are accurate. This is a challenge!
- So we seek “ground truth” tests that we then feed into their algorithms to evaluate the answers they produce.
- Ground truth data is expensive and sometimes impossible to acquire.
- Numerical wavefield simulation provides the best ground truth and it works in ANY environment

# Important Modeling Features

- Must be able to handle borehole acoustic modeling for frequencies up to 40 kHz
- Hard and soft rocks
- Anisotropy up to orthorhombic symmetry with tilt
- Handles any source/receiver geometry
- Handles any borehole shape (elliptical, circular, rugose)
- Handles interbedding with strike/dip

# Important Solution Features

- Do not “reinvent the wheel”
- Very fast (one simulation within an hour)
- User and computationally scalable
- Generalized for flexible usage
- Point-and-click and one-stop-shopping
- Use cloud’s pay-as-you-go usage model

# Borehole Acoustic Logging

- Borehole drilled through formations, with or without casing and cement
- Wireline and LWD tools have sources and receiver arrays
- Source fires a pulse into the water, which goes into formations
- Some energy returns to the receiver array
- Array processing techniques are used to measure elastic properties of the formation and its pore fluids
- Relates to drilling safety, borehole stability, formation evaluation, reservoir characterization, and completion planning

# Sonic3D Description

- Create 3D models of compressional velocity, shear velocity, and density
- Discretization of model into tens of “mega pixels”
- Impart receivers at specific location(s)
- Impart source(s) at specific location(s)
- Create source function(s) that will be transmitted at each source location
- Solve full elastic wave equation for stresses and particle velocities using an explicit method (finite difference time domain)
- Iterate for tens of thousands of time steps
- Absorb the reflections that would normally occur at the model boundaries

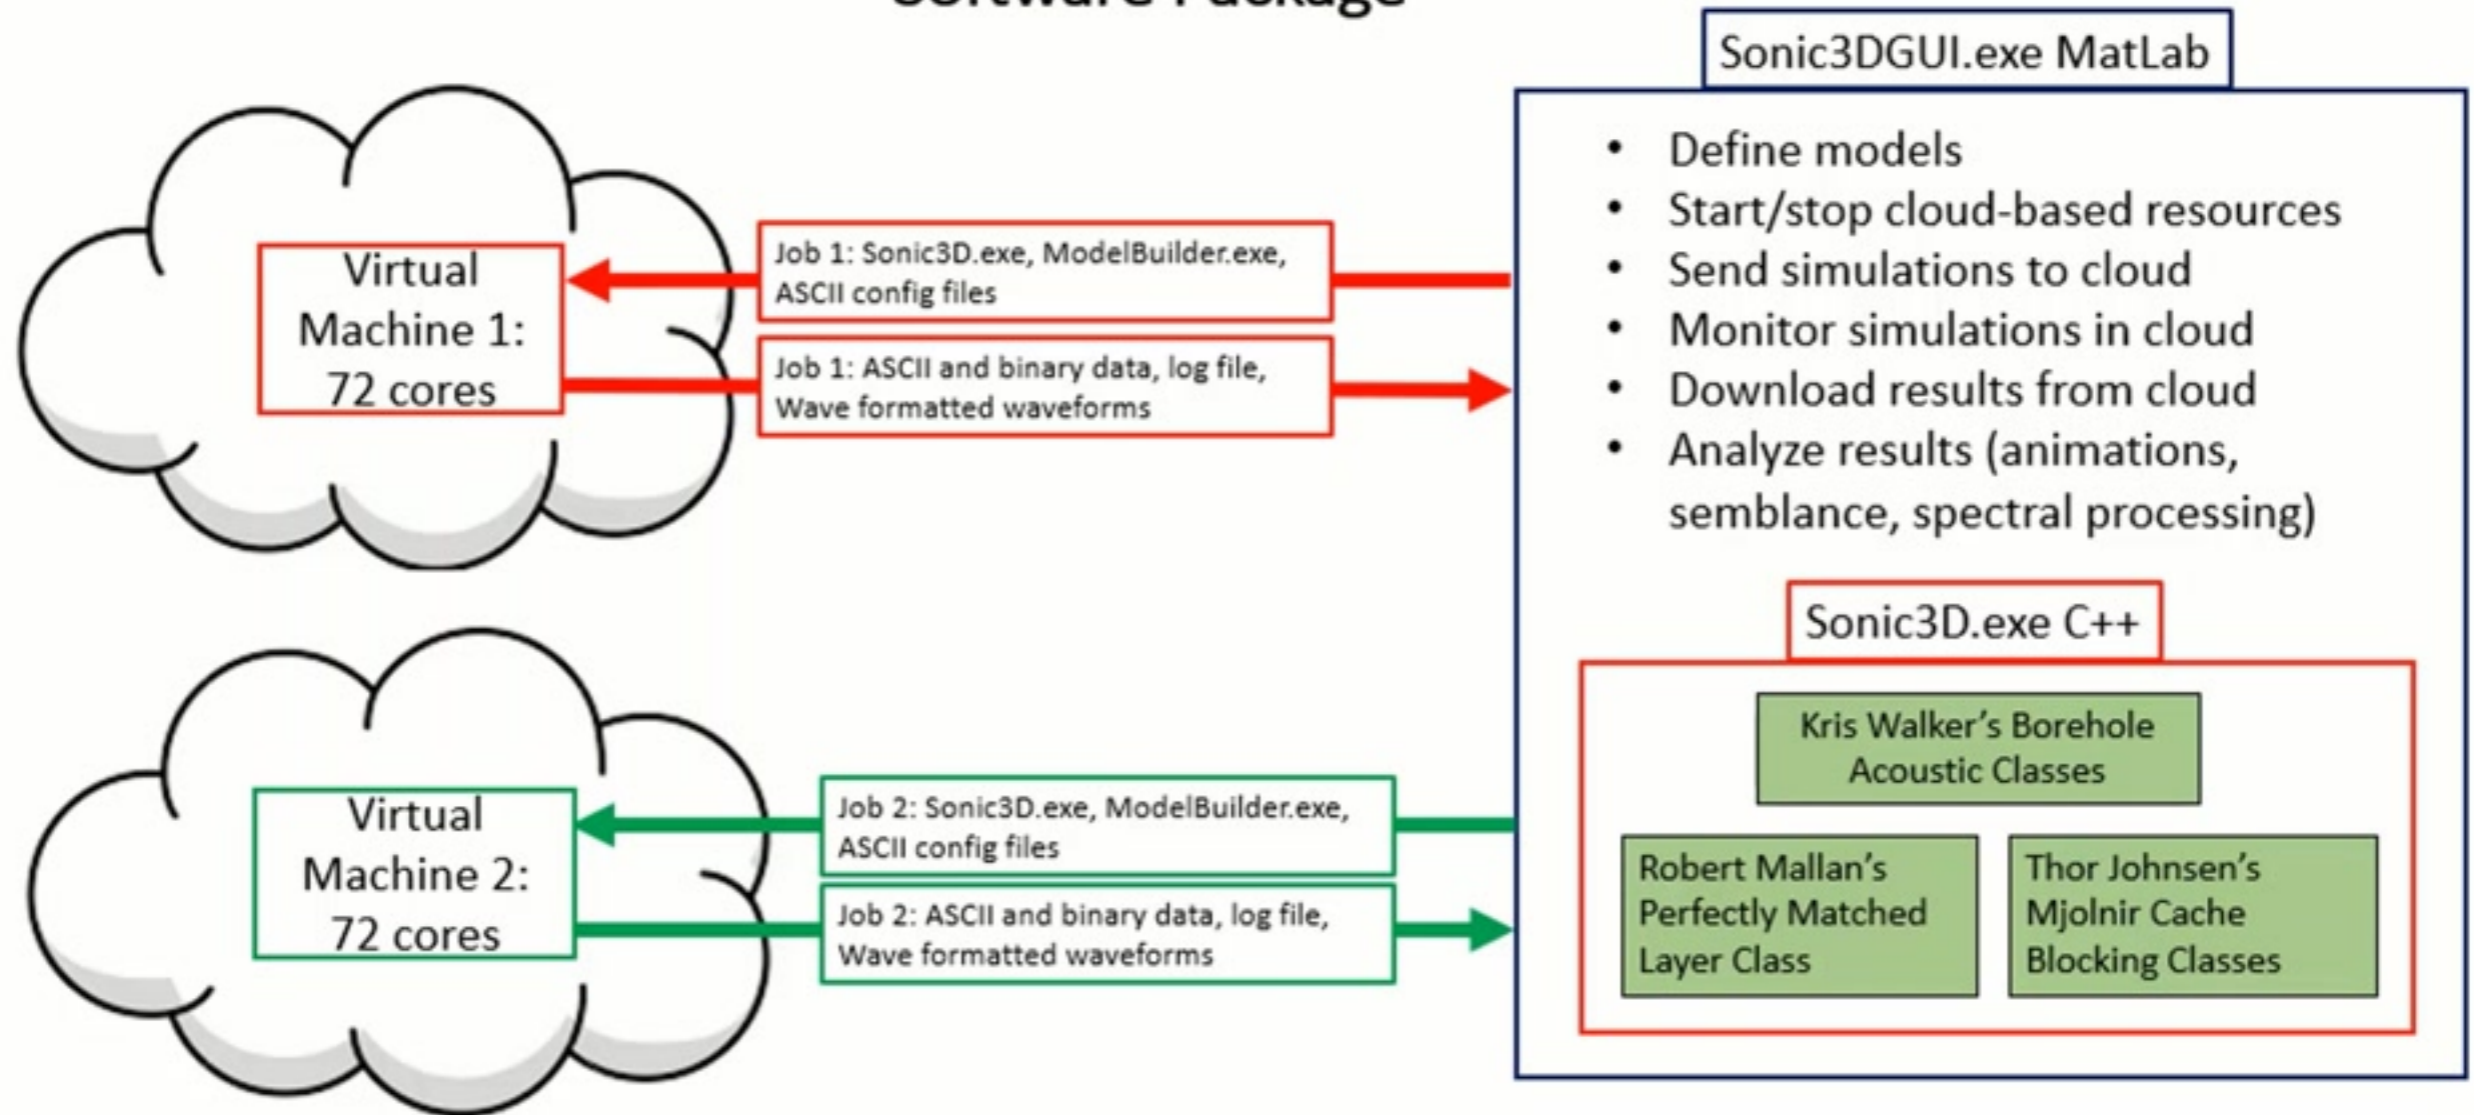

# Sonic3D Description

- Create 3D models of compressional velocity, shear velocity, and density
- Discretization of model into tens of “mega pixels”
- Impart receivers at specific location(s)
- Impart source(s) at specific location(s)
- Create source function(s) that will be transmitted at each source location
- Solve full elastic wave equation for stresses and particle velocities using an explicit method (finite difference time domain)
- Iterate for tens of thousands of time steps
- Absorb the reflections that would normally occur at the model boundaries

# Sonic3D Borehole Acoustic Wavefield Modeling Software Package

# Programmatically Starting/Stopping Cloud-Based Resources with MATLAB's System Command

- To start/stop resources, you first need to acquire your Access Token (also called Authentication Token)
- We send a REST POST command to the VM manager using the ubiquitous “Curl” program to get the Access Token as well as start/stop the VM's
- We execute the following “Curl” command via MATLAB's system command to obtain the Access Token:

```
curl -X POST -d  
"grant_type=client_credentials&client_id=[APPLICATION_ID]&client_secret=  
[PASSWORD]&resource=https%3A%2F%2Fmanagement.azure.com%2F"  
https://login.microsoftonline.com/[TENANT_ID]/oauth2/token
```

# Programmatically Starting/Stopping Cloud-Based Resources with MATLAB's System Command

- To start/stop resources, you first need to acquire your Access Token (also called Authentication Token)
- We send a REST POST command to the VM manager using the ubiquitous "Curl" program to get the Access Token as well as start/stop the VM's
- We execute the following "Curl" command via MATLAB's system command to obtain the Access Token:

```
curl -X POST -d  
"grant_type=client_credentials&client_id=[APPLICATION_ID]&client_secret=  
[PASSWORD]&resource=https%3A%2F%2Fmanagement.azure.com%2F"  
https://login.microsoftonline.com/[TENANT_ID]/oauth2/token
```

# Programmatically Starting Cloud-Based Resources with MATLAB's System Command

- In the curl command you pass your Access Token as a header (with -H)
- You pass the Application ID and Password as data variables (-d)
- Lastly, you pass the Subscription ID, Resource Group, and VM Name as part of the URL string.
- You keep a map between IP address and VM Name
- The command is shown below. The key command being executed here is called "start".

```
curl -X POST -H "Authorization: Bearer [TOKEN]" -d  
"grant_type=client_credentials&client_id=[APPLICATION_ID]&client_secret=  
[PASSWORD]&resource=https%3A%2F%2Fmanagement.azure.com%2F"  
https://management.azure.com/subscriptions/[SUBSCRIPTION_ID]/resourceGro  
ups/[RESOURCE_GROUP]/providers/Microsoft.Compute/virtualMachines/[VM_NAM  
E]/start?api-version=2019-07-01
```

# Programmatically Stopping Cloud-Based Resources with MATLAB's System Command

- Shutting down your VM also requires the Access Token, as well as the other parameters described in Starting your VM.
- Only difference is instead of executing a “start”, you are executing a “deallocate”
- **Warning: if you use “powerOff”, machine will remain “allocated” and continue to incur usage costs**

```
curl -X POST -H "Authorization: Bearer [TOKEN]" -d  
"grant_type=client_credentials&client_id=[APPLICATION_ID]&client_secret=  
[PASSWORD]&resource=https%3A%2F%2Fmanagement.azure.com%2F"  
https://management.azure.com/subscriptions/[SUBSCRIPTION_ID]/resourceGro  
ups/[RESOURCE_GROUP]/providers/Microsoft.Compute/virtualMachines/[VM_NAM  
E]/deallocate?api-version=2019-07-01
```

# Sonic3D: Main Window

All model data is stored in a database archive directory of your choosing using the "Set Home" button

Once a model is complete and downloaded, the Analysis tools can be used on it by clicking on that row and selecting the analysis button

The screenshot shows the Sonic3D GUI with a table of models and a control panel on the right. The table has columns for Model Name, Server, and Status. The control panel has buttons for Set Home, Set Servers, Start VMs, Stop VMs, Home Notes, New Model, Copy Model, Rename Model, Delete Model, Edit Model, Model Notes, Launch, Reset, Terminate, Download, Semblance, Simulation, Wipe Server, Open Directory, Scan Servers, and Monitor.

File Edit

The ModelBuilderGUI window displays three 2D plots. The left plot shows a circular formation in the XY plane, centered at (0,0) with a radius of approximately 0.11 m. The X and Y axes range from -0.3 to 0.3 m. The middle plot shows a cross-section in the XZ plane, with a vertical central bar and two diagonal bars extending from the center to the edges. The Z-axis ranges from 0 to 5.595 m, and the X-axis ranges from -0.3 to 0.3 m. The right plot shows a cross-section in the YZ plane, with a vertical central bar and two diagonal bars extending from the center to the edges. The Z-axis ranges from 0 to 5.595 m, and the Y-axis ranges from -0.3 to 0.3 m.

# MATLAB Specific Development Notes

- Sonic3D GUI developed with GUIDE
- GUIDE being replaced by App Designer
- Both are feature rich
- Both are easy to use and expand upon, but I've found App Designer to be much easier to use
- App Designer's responsiveness is faster than GUIDE's
- App Designer has buttons to:
  - Convert to a stand-alone \*.exe
  - Deploy the GUI to a VM as a "Web App"
- Pluses of using App Designer grossly outweigh those for GUIDE
