

Modeling Motion Control Systems in Air and Space Vehicles

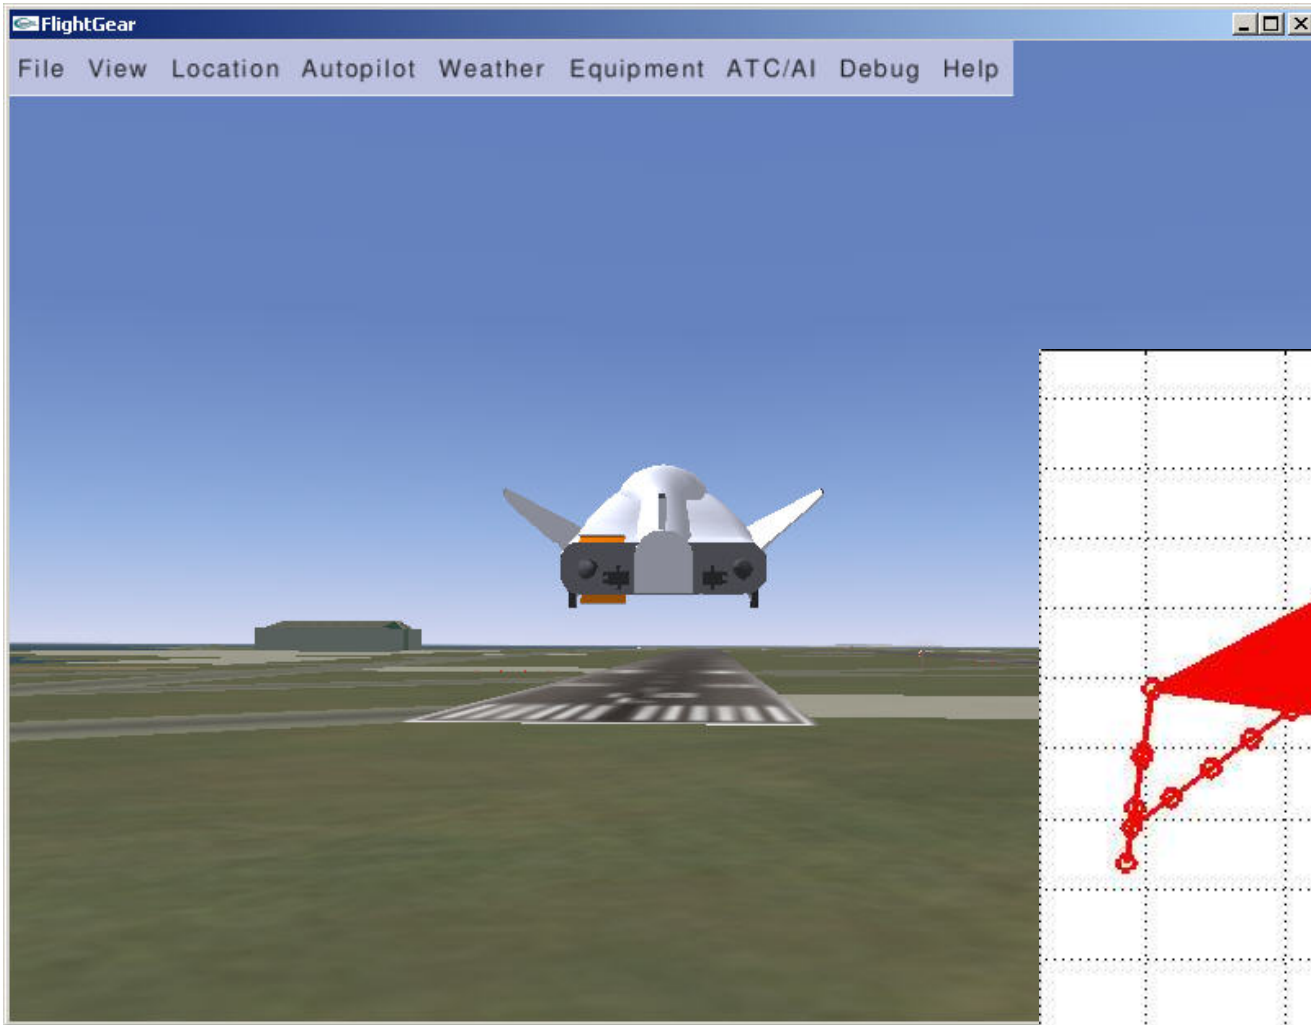

Terry Denery, PhD
The MathWorks

© 2007 The MathWorks, Inc.

MathWorks
Aerospace and Defense Conference '07

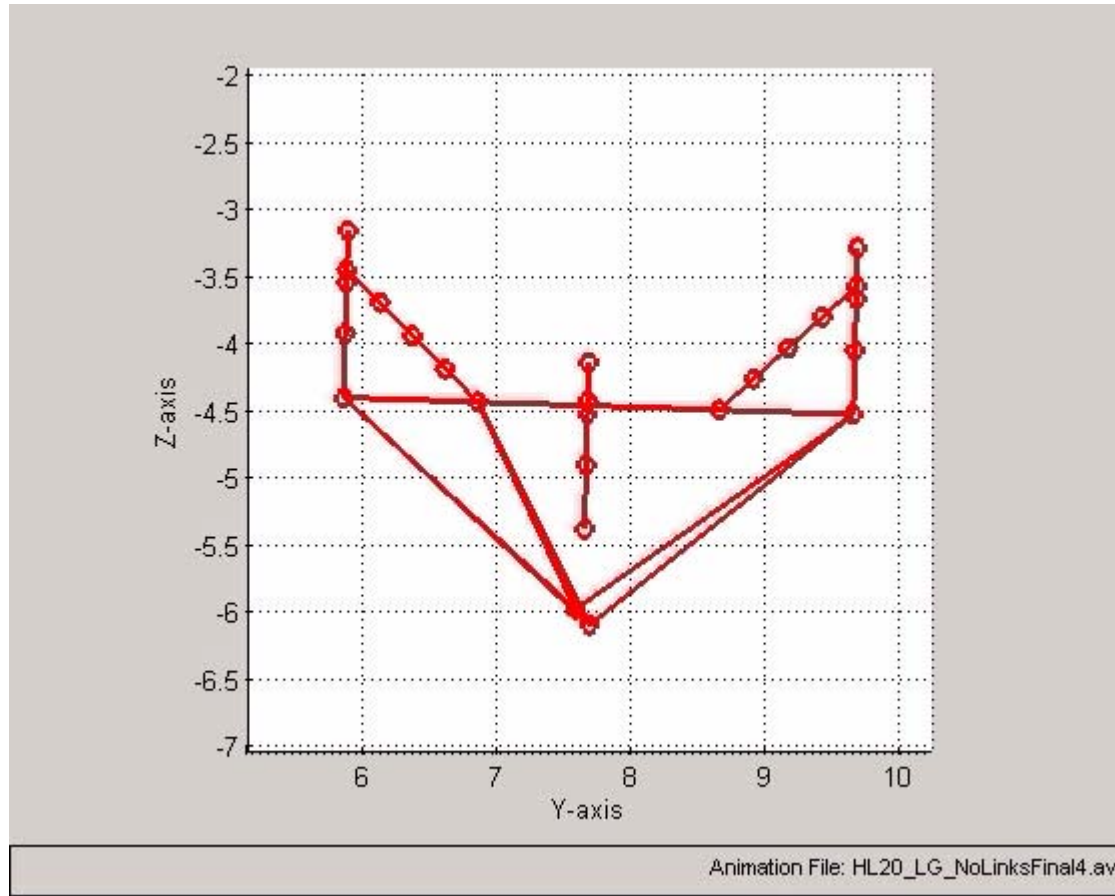

Agenda

- Linkage motion in accelerating vehicles
- Adaptation to workflows and adoption of standards
- Demonstration
 - Flight simulation for landing gear design
 - Flight simulation for satellite design

Linkage Motion in Accelerating Vehicles

Inertial (Non-Accelerating) Reference Frames

$$\vec{\mathbf{F}} = m\vec{\mathbf{a}}$$

*Not
An Option!*

Non-Inertial (Accelerating) Reference Frames

$$\vec{\mathbf{F}} \neq m\vec{\mathbf{a}}$$

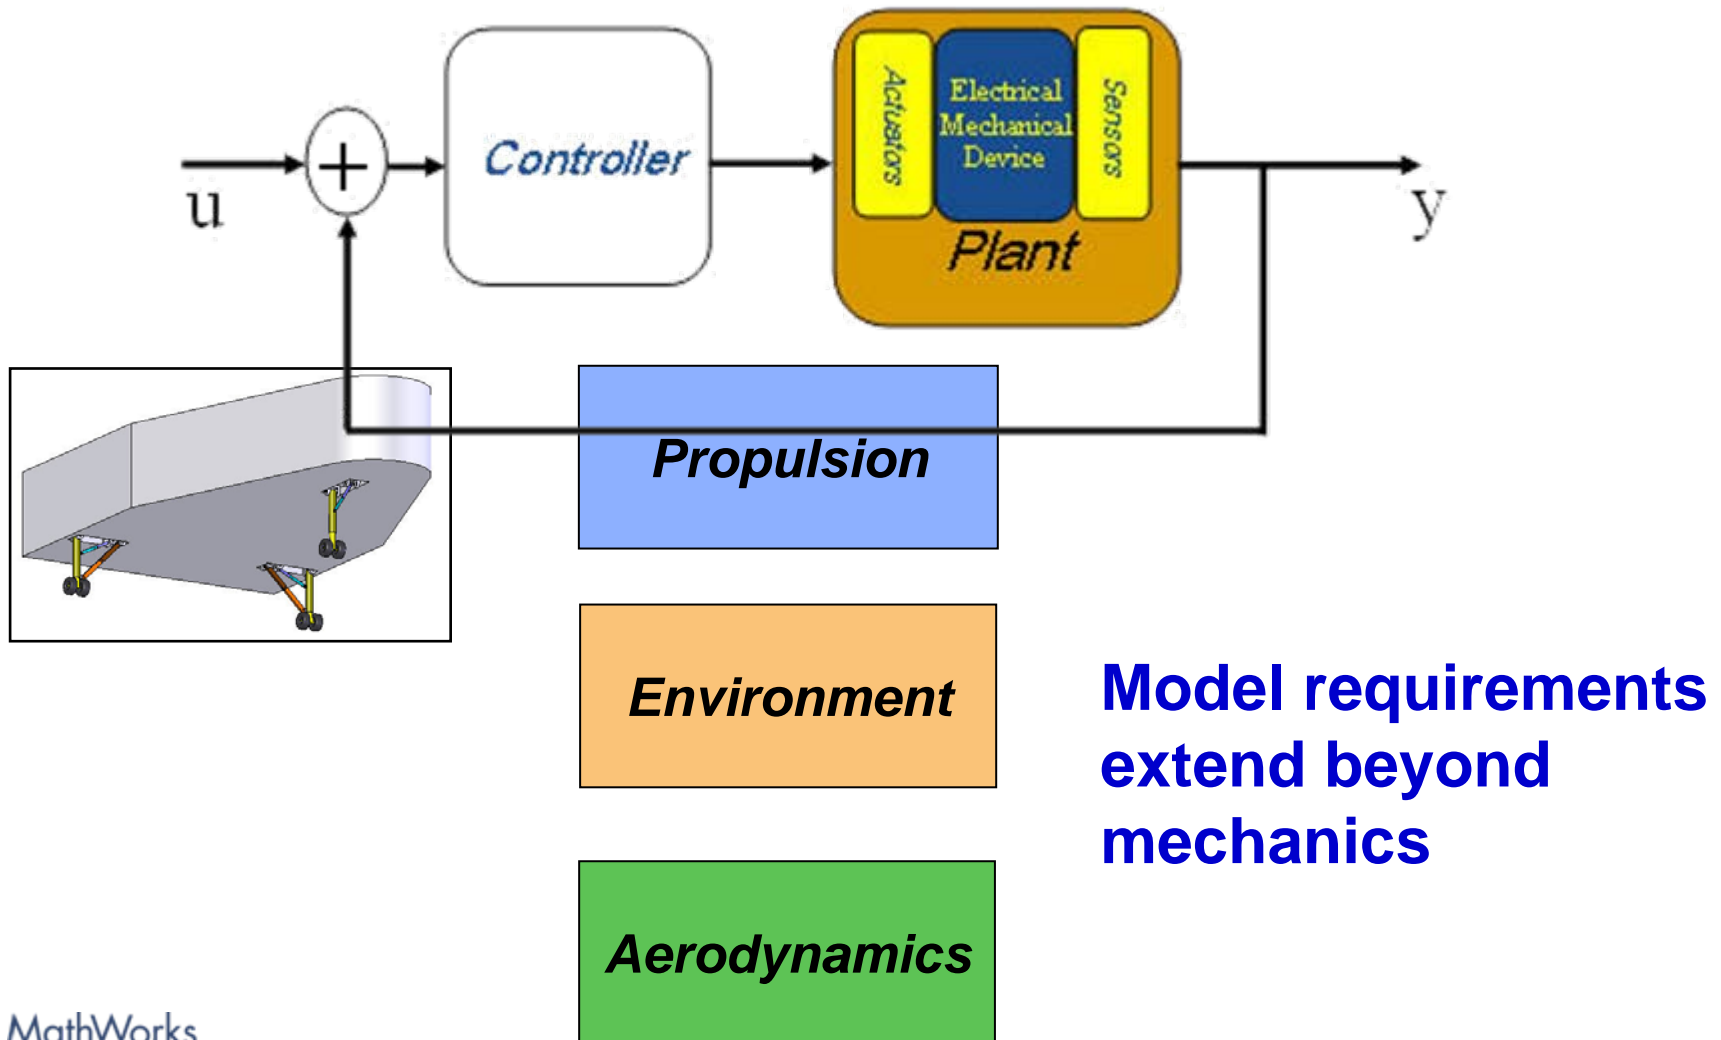

*Very
Difficult!*

Linkage Motion in Accelerating Vehicles

Model the Entire System

Linkage Motion in Accelerating Vehicles

Model requirements extend beyond mechanics

Adaptation and Adoption

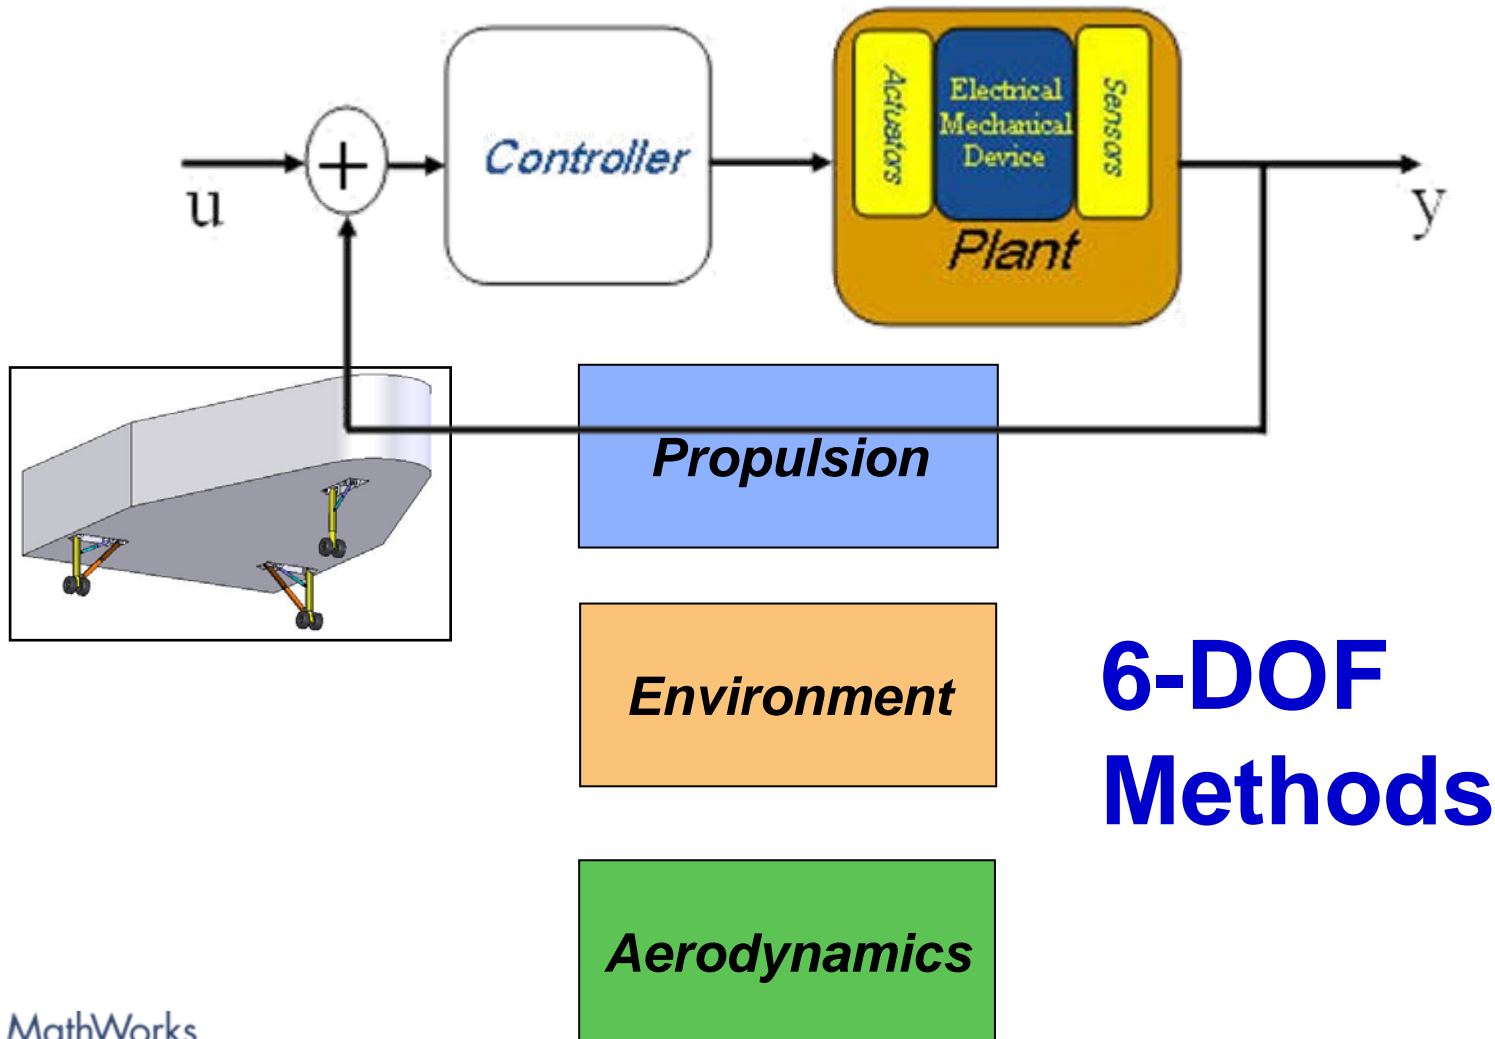

■ *Adaptation*

- 6DOF methods to include Multi-body
- Adapting to Cross-Domain Collaboration

■ *Adoption*

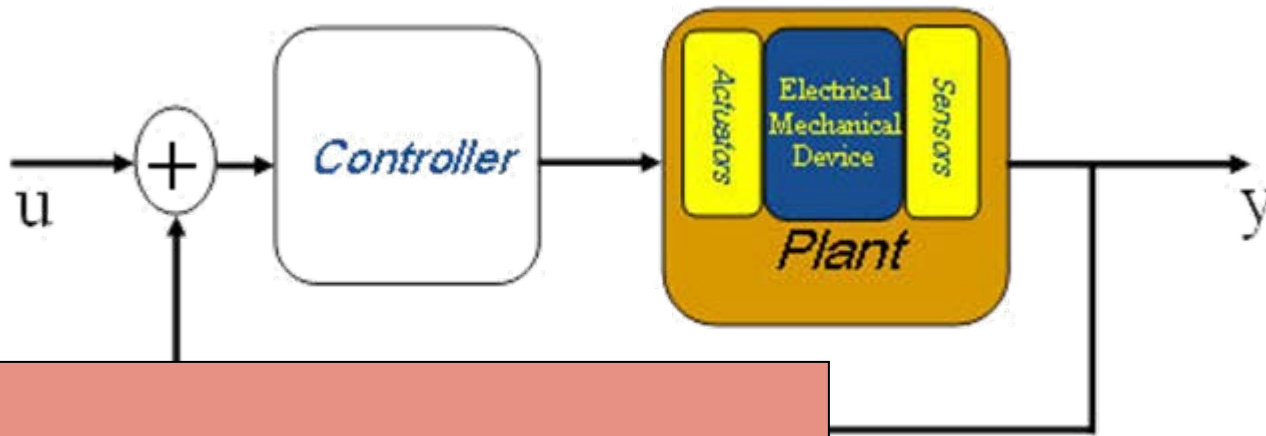

- Standards for Describing Position and Orientation

Adapting 6-DOF to Multi-Body Methods

**6-DOF
Methods**

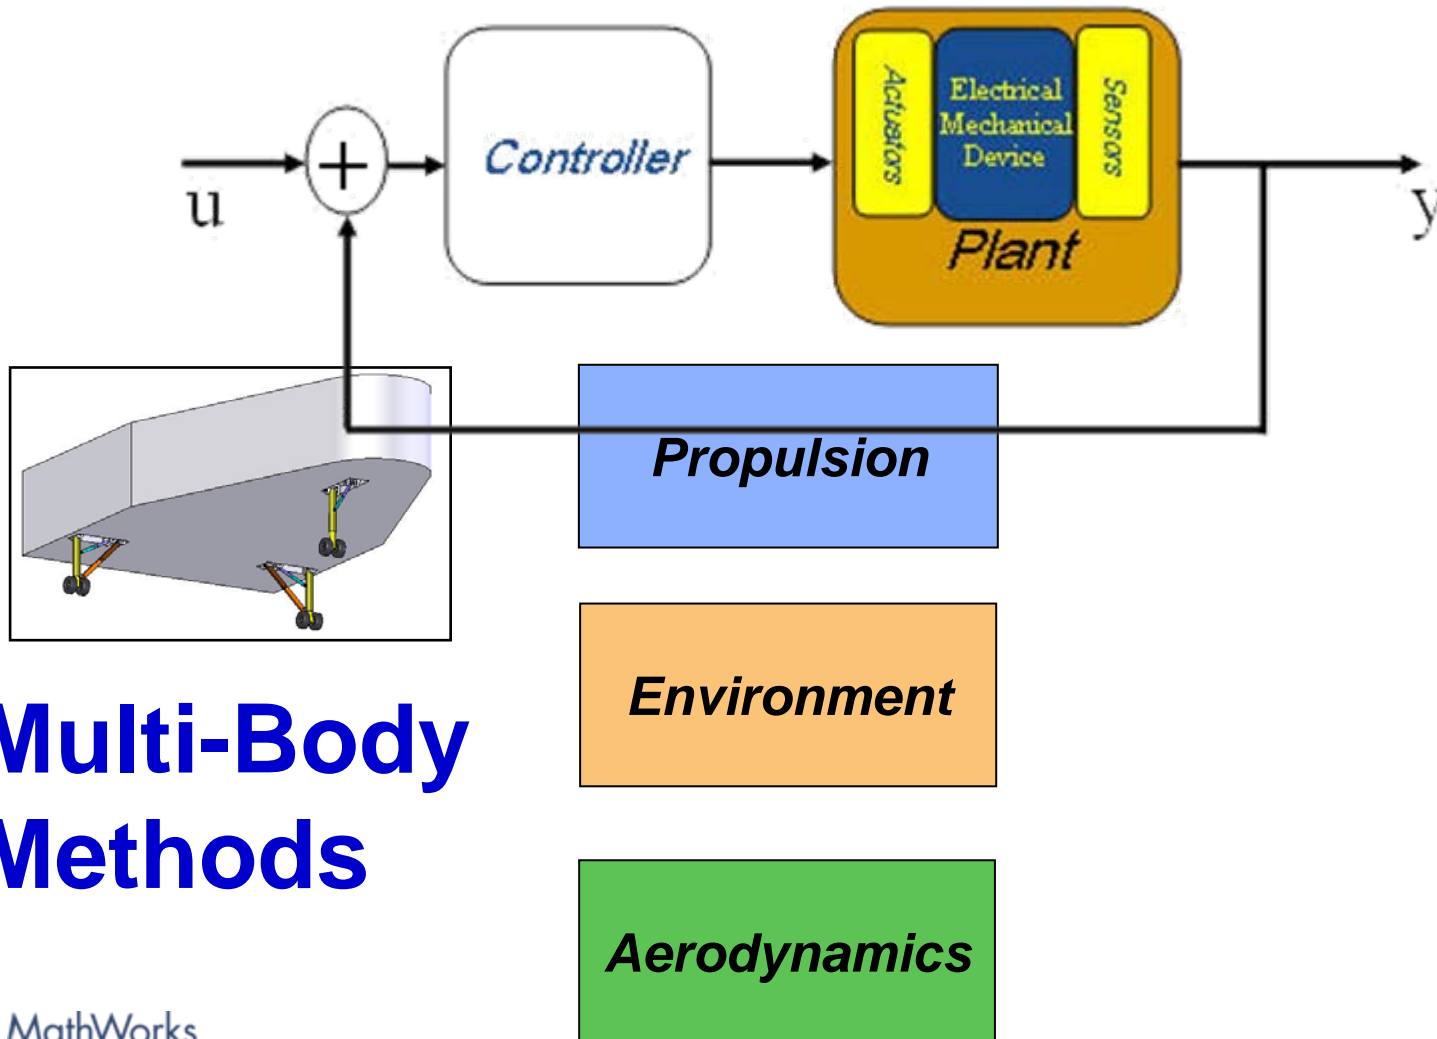

Adapting 6-DOF to Multi-Body Methods

Demonstration – Flight Simulation for Designing Landing Gear

Demonstration – Landing Gear

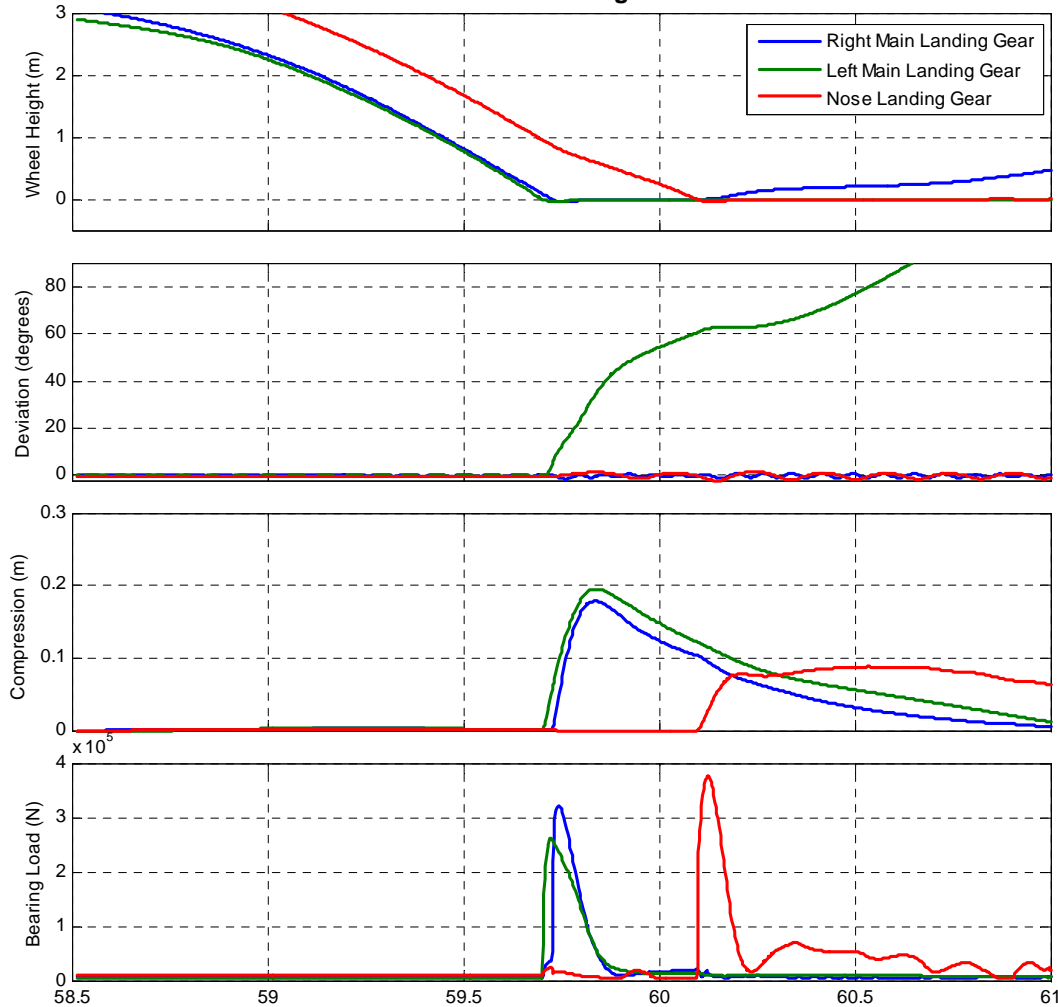

Two-Wheel Successful Landing

Demonstration – Landing Gear

One Wheel Landing - Crash

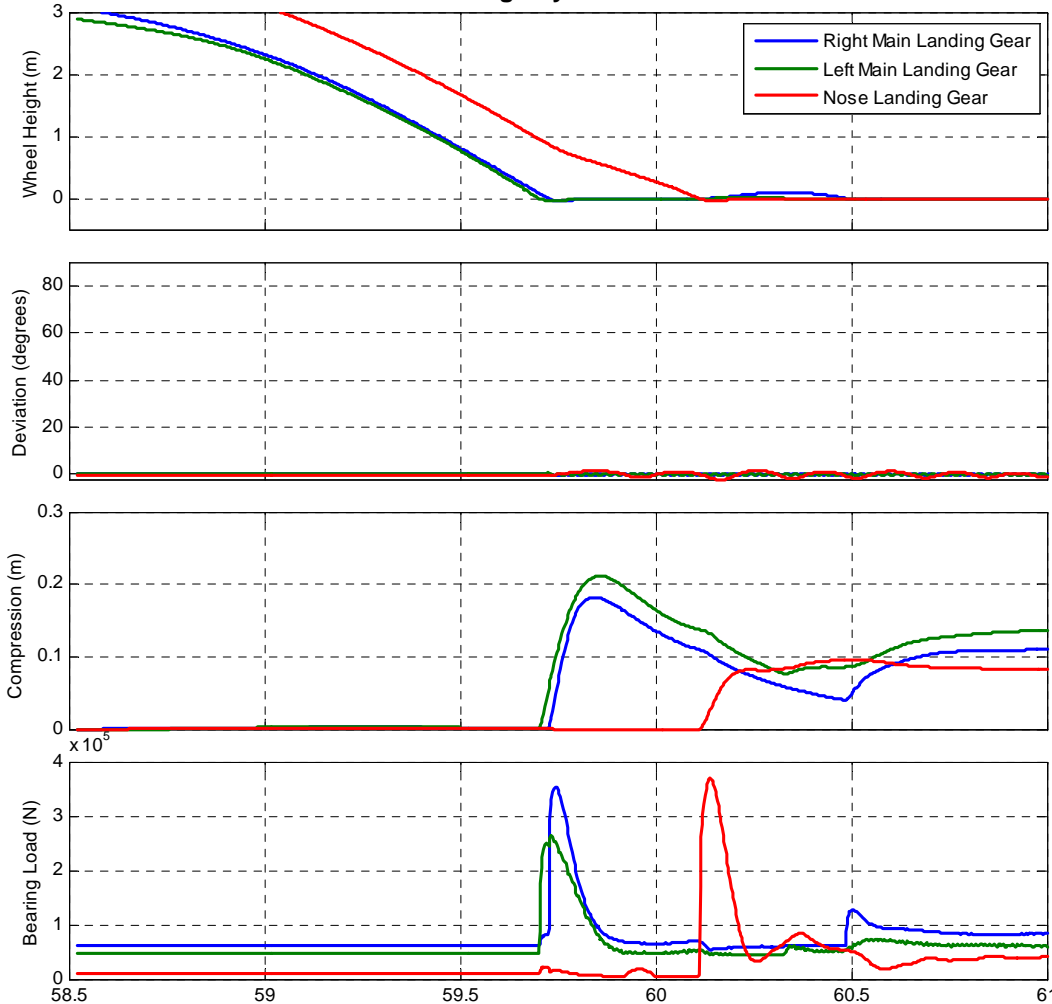

One-Wheel Failed Landing

Demonstration – Landing Gear

One Wheel Landing - Hydraulic Pressure Fixed

One-Wheel Successful Landing

Demonstration – Landing Gear

- Employed 6-DOF based on SimMechanics
- Developed contact model for wheel-ground interaction
- Identified method for linkage design in air vehicles

Demonstration – Flight Simulation of Satellite

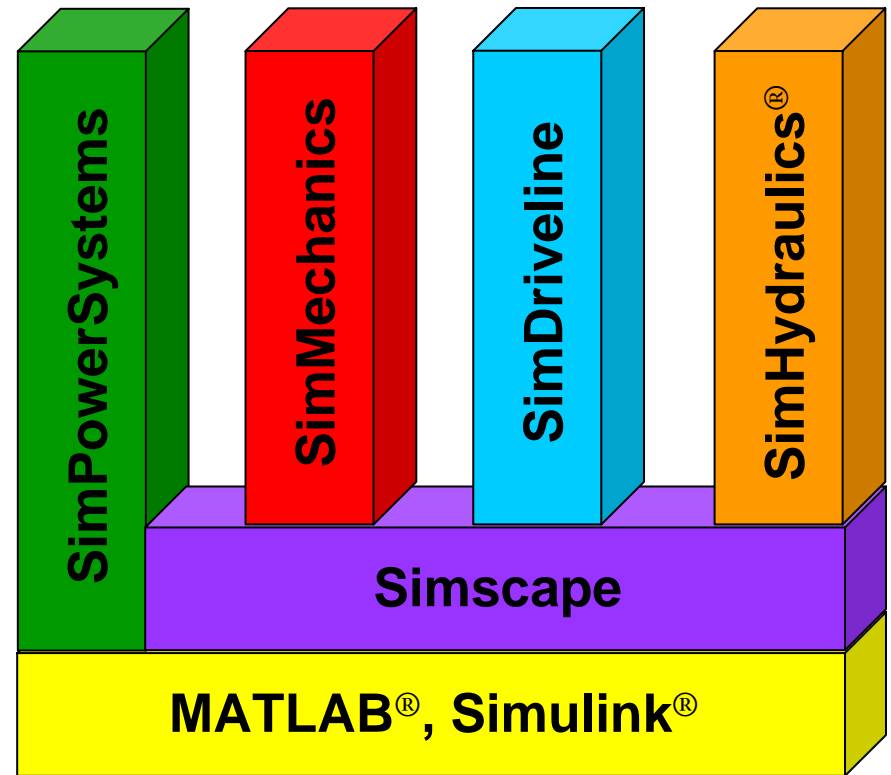

- Maximize power through solar array position
- Point camera at targets

Demonstration – Flight Simulation of Satellite

- Developed pointing system
- Developed motion model for orbital mechanics
- Identified general method for linkage control design in space vehicles

What Next?

- Design Hydraulic Actuation for Landing Gear
- Design Electric Actuation for Satellite
- Design Reaction Wheel Actuation for Satellite

Complete solution enabled for mechanics, power transmission, and actuation

In summary

- Developed flight simulations
 - Landing gear design
 - Satellite design
- Simulink enables the adaptation and adoption to create collaborative workflow
- Established general solution for motion systems in air and space vehicles
